

Note: While it is not needed in all locations by default I have been using exclusively metal film resistors.

Note: Originally the design used an OPA134 instead of the LME49710 for the 1st stage.

Note: Not all meta data is shown. (ex. resistor composition)

Note: My apologies regarding the reference designators they are done to match prior documentation.

Note: Many thanks to Smokie the backwards VREG footprint.

Note: Some parts (capacitors) have specific model numbers because they are known to fit the PCB footprints nicely. You need not use those exact parts.

Note: The pinout of CONN1 & CONN4 is not the pinout of the MiniHEX9's just the pinout of wires too them.
